Block Autosave on Specific Sites

Bitwarden browser extensions can be configured to exclude specific sites from triggering [autosave notifications](#). When a domain is in the **Excluded domains** list, Bitwarden won't issue the notification any of the available notifications, including to save a new login, update an existing login, or to save or use a passkey:

Ask to add login

To configure excluded domains, navigate to **Settings** → **Notification** → **Excluded domains**:

Excluded Domains Configuration

Domain exclusion does not register "full" URLs, only the domain component. For example, <https://github.com/bitwarden/browser> would resolve to github.com when saved, meaning that the browser extension would explicitly not offer to save credentials for Github.
